### Product Description

The BDA4620 is a broadband, Highly accurate 50Ω digital step attenuator model which provides adjustable attenuation from 0 to 31.5 dB in 0.5 dB steps. The control is a 6-bit serial interface and latched parallel interface.

BDA4620 supports a broad operating frequency range from 1MHz to 8.0 GHz. BDA4620 is offering the High linearity, low power consumption, low insertion loss and high attenuation accuracy at all frequency band.

The device features a safe state transitions with no negative/positive Glitch technology optimized for excellent step accuracy.

Basically the RF input and output are internally matched to 50Ω and do not require any external matching components. Besides there is no need for DC blocking Capacitor If DC is not presented at the RF Port . In some cases to optimized Return loss for above 4 - 8GHz, Shunt capacitor can be added near RF1 and RF2 respectively. The design is bi-directional; therefore, the RF input and output are interchangeable.

This DSA does not require blocking capacitors. If DC is presented at the RF port, add a blocking capacitor. It is packaged in a RoHS2-compliant with QFN surface mount package.

### Application

- 6G/5G/4G/3G Cellular Base station/Repeater Infrastructure
- Digital Pre-Distortion
- Distributed Antenna Systems, DAS
- Remote Radio Heads
- NFC Infrastructure
- Test Equipment and sensors
- Military Wireless system
- Cable Infrastructure
- General purpose Wireless

1. RF pins 2 and 14 must be at 0V DC. The RF pins do not require DC blocking capacitors for proper Operation if the 0V DC requirement is met.

2. Ground D0 - D5 if not in use or serial mode.

### Programming Options

BDA4620 can be programmed using either the parallel or serial interface, which is selectable via P/S pin(Pin13). Serial mode is selected by pulling it to a voltage logic HIGH and parallel mode is selected by setting P/S to logic LOW

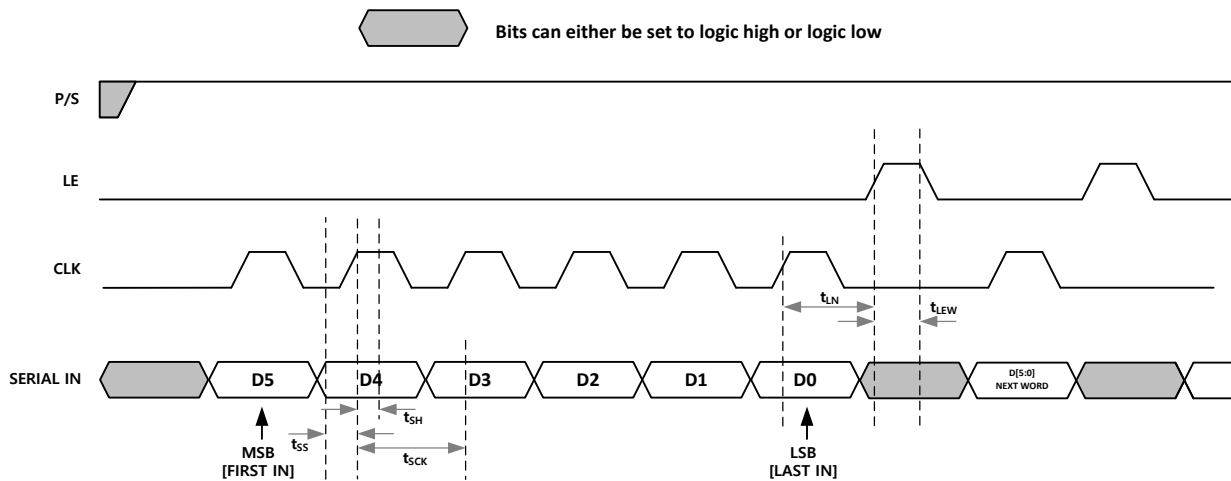

### Serial Control Mode

The serial interface is a 6-bit shift register to shift in the data MSB (D5) first. When serial programming is used, It is recommended all the parallel control input pins (1, 15, 16, 17, 19, 20) are grounded. It is controlled by three CMOS-compatible signals: SERIN, Clock, and Latch Enable (LE).

**Table 7. Truth Table for Serial Control Word**

Digital Control Input						Attenuation state (dB)
D5 (MSB)	D4	D3	D2	D1	D0 (LSB)	
LOW	LOW	LOW	LOW	LOW	LOW	0 (RL)
LOW	LOW	LOW	LOW	LOW	HIGH	0.5
LOW	LOW	LOW	LOW	HIGH	LOW	1

LOW	HIGH	LOW	LOW	LOW	LOW	8
HIGH	LOW	LOW	LOW	LOW	LOW	16
HIGH	HIGH	HIGH	HIGH	HIGH	HIGH	31.5

**Figure 5. Serial Mode Timing Diagram**

The BDA4620 has a 3-wire serial peripheral interface (SPI): serial data input (SERIN), clock (CLK), and latch enable (LE). The serial control interface is activated when P/S is set to HIGH.

In serial mode, the 6-bit Data is clocked MSB first on the rising CLK edges into the shift register and then LE must be toggled HIGH to latch the new attenuation state into the device. LE must be set to LOW to clock new 6-bit data into the shift register because CLK is masked to prevent the attenuator value from changing if LE is kept HIGH (see Figure 5 and Table 7).

**Table 8. Serial Interface Timing Specifications**

### Serial Register Map

The BDA4620 can be programmed via the serial control on the rising edge of Latch Enable (LE) which loads the last 6-bits data word in the SHIFT Register. Data is clocked in MSB(D5) first.

**Figure 6. Serial Register Map**

The attenuation word is derived directly from the value of the attenuation state. To find the attenuation word, multiply the value of the state by two, then convert to binary.

For example, to program the 15.5dB state :

$$2 \times 15.5 = 31$$

D0 — D5 : 111110

Serial Input : 111110

1	1	1	1	1	0
D0	D1	D2	D3	D4	D5

### Power-UP states Settings

The BDA4620 will always initialize to the maximum attenuation setting (31.5 dB) on power-up for both the Serial and Latched Parallel modes of operation and will remain in this setting until the user latches in the next programming word.

In Direct Parallel mode, the DSA can be preset to any state within the 31.5 dB range by pre-setting the Parallel control pins prior to power-up. In this mode, there is a 400 μs delay between the time the DSA is powered-up to the time the desired state is set.

**Figure 7. Default Attenuation word for Power-up state**

### Programming Options

#### Parallel Control Mode

The parallel control interface has seven digital control input lines (D5 to D0) to set the attenuation value. D5 is the most significant bit (MSB) that selects the 16 dB attenuator stage, and D0 is the least significant bit (LSB) that selects the 0.5 dB attenuator stage.

#### Direct Parallel Mode

For direct parallel mode, The LE pin must be kept HIGH. The attenuation state is changed by the control voltage inputs (D0 to D5) directly. This mode is ideal for manual control of the attenuator. In this mode the device will immediately react to any voltage changes to the parallel control pins [pins 1, 15, 16, 17, 19, 20]. Use direct parallel mode for the fastest settling time.

#### Latched Parallel Mode

The LE pin must be kept LOW when changing the control voltage inputs (D0 to D5) to set the attenuation state. When the desired state is set, LE must be toggled HIGH to transfer the 6-bit data to the bypass switches of the attenuator array, and then toggled LOW to latch the change into the device until the next desired attenuation change (see Figure 8 and Table 10).

- Set P/S is logic LOW.
- Set LE to logic LOW.
- Adjust pins [1, 15, 16, 17, 19, 20] to the desired attenuation setting. (Note the device will not react to these pins while LE is a logic LOW).
- Pull LE to a logic HIGH. The device will then transition to the attenuation settings reflected by pins D5 - D0.
- If LE is pulled to a logic LOW then the attenuator will not change state.

Latched Parallel Mode implies a default state for when the device is first powered up with P/S pin set for logic LOW and LE logic LOW. In this case the default setting is **Maximum attenuation**.

### Switching Feature Description

#### Glitch-Safe Attenuation State Transient

The BDA4620 is the latest product applied *Glitch-Safe* technology with less than 1dB ringing (pos/neg) across the attenuation range when changing attenuation states. This technology protects Amplifiers or ADC during transitions between attenuation states. (see Figure 33,34).

### BDA4620 Evaluation board Kit Description

Figure 49. BDA4620 EVK

#### Evaluation board Kit Introduction

BDA4620 Evaluation Kit is made up of a combination of an RF board and an interface board

The schematic of the BDA4620 evaluation RF board is shown in Figure 49. The BDA4620 evaluation RF board is constructed of a 4-layer material with a copper thickness of 0.7 mils on each layer. Every copper layer is separated with a dielectric material. The top dielectric material is 8 mils RO4003. The middle and bottom dielectric materials are FR-4, used for mechanical strength and overall board thickness of approximately 1.63mm.

BDA4620 Evaluation INTERFACE board is assembled with a SP3T switches(D0~D5,LE), SP2T mechanical switch (P/S), and several header & switch.

#### Evaluation Board Programming Using USB Interface

In order to evaluate the BDA4620 performance, the Application Software has to be installed on your computer. And The DSA application software GUI supports Latched Parallel and Serial modes. software can be downloaded from BeRex's website

#### Serial Control Mode

- Connect directly the Evaluation INTEFRACE board USB port(J3) to PC
- Set the direction of P<->S Switch to S direction (P/S Logic HIGH)
- Set the D0~D5, LE switch to the middle position.
- Operate the 0~31.5dB attenuation state in GUI and then control the DSA

#### Latched Parallel Control Mode

- Connect directly the Evaluation INTEFRACE board USB port(J3) to PC
- Set the direction of P<->S Switch to P direction (P/S Logic LOW)
- Set the D0~D5, LE switch to the middle position.
- Operate the 0~31.5dB attenuation state in GUI and then control the DSA

#### Direct Parallel Control Mode

- Set the direction of P<->S Switch to P direction (P/S Logic LOW)
- Set LE switch to the LOW Position
- For the setting to attenuation state, D0~D5 switches can be combined in manually program, refer to Table 10.

Please refer to user manual for more detailed operation method of BDA4620 EVK.
